

Instructions to run the API:

1- run creates.sql in a mysql browser. This will create the tables and use the proper triggers.

2- run inserts.sql in the same mySQL browser, this will insert random/test data, the data in it is only used to showcase the application and how it works.

3- run python and use pip install -r requirements.txt to install the dependancies.

4- run the API by running runserver.py

5- in Android studio, open the API<ApiClient.java class and modify the BASE_URL and add the host machine URL.

6- compile the application and run it!
